Primeras causas de muerte:

1. Cáncer
2. Enfermedades Cardiovasculares
3. Diabetes
4. Alzheimer

¿Son los pesticidas parte del problema del deterioro de la salud de las personas?

Ultimo informe de la ONU

Los plaguicidas provocan 200.000 muertes al año

Un informe encargado por la ONU advierte del peligro para las personas y el medio ambiente de los productos químicos insecticidas y herbicidas

A los herbicidas se les ha relacionado con "el cáncer, el Alzheimer, el Parkinson, alteraciones hormonales, trastornos en el desarrollo y esterilidad" dice el Informe de las Naciones Unidas, de los que también dicen que son la causa de unas 200.000 muertes anuales por intoxicación aguda.

¿Se necesitan los pesticidas para trabajar con el hambre en el mundo?

Cita del informe sobre los pesticidas de la ONU-2017

– “**El empleo de los herbicidas
nada tiene que ver
con la resolución
del problema del hambre”.**

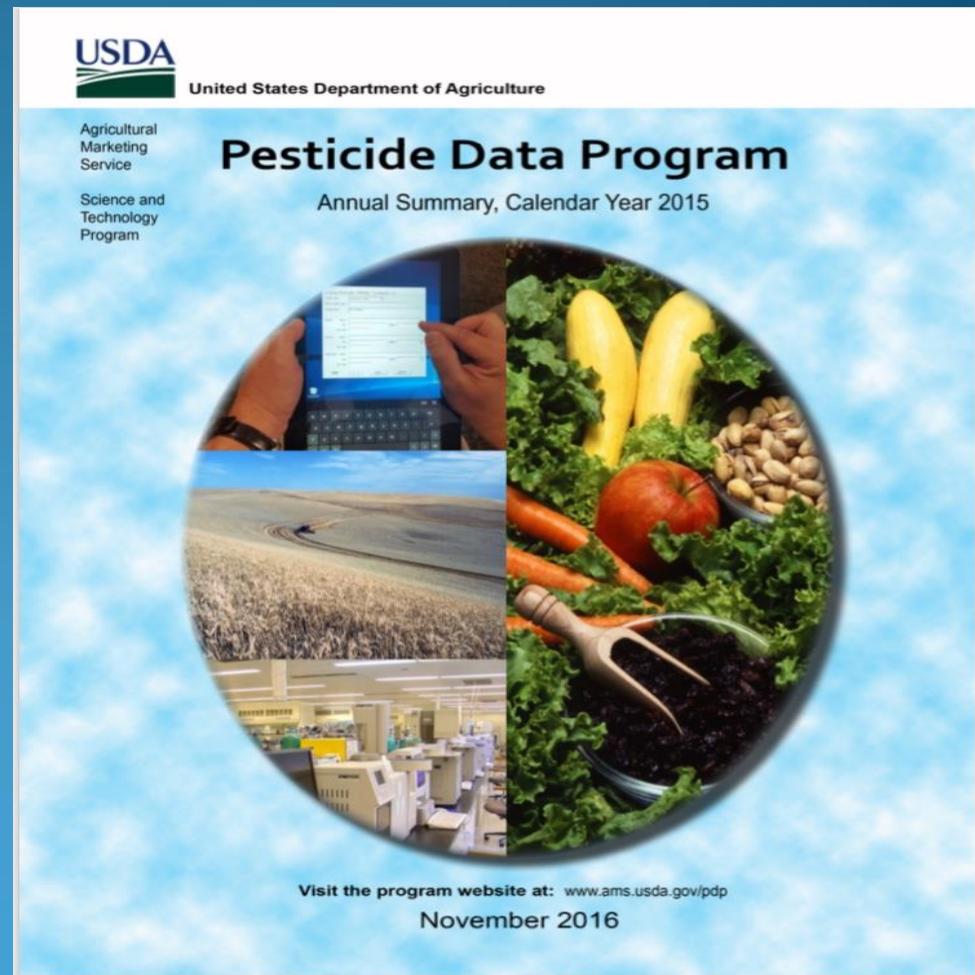

– **Hilal Elver, ONU.**

Uso y abuso de pesticidas en Estados Unidos

El Departamento de Agricultura Federal en su reporte del 2015 analizó sobre 10,000 muestras de alimentos y encontró residuos de pesticidas en el 85% de las muestras.

El análisis incluyó a sobre 400 pesticidas: fungicidas, insecticidas, herbicidas, etc.

El reporte no analizó los residuos de glifosato en los alimentos.

Los alimentos más contaminados son los siguientes:

1. fresas- 38
2. tomates- 27
3. nectarines- 24
4. Uvas-23
5. Espinacas-23
6. Peras- 20
7. Cherries- 20
8. Pepinillos- 18
9. Melocotones- 16
10. Manzanas-16
11. Lechuga-14
12. Habichuelas tiernas- 12
13. Papas-10

El glifosato

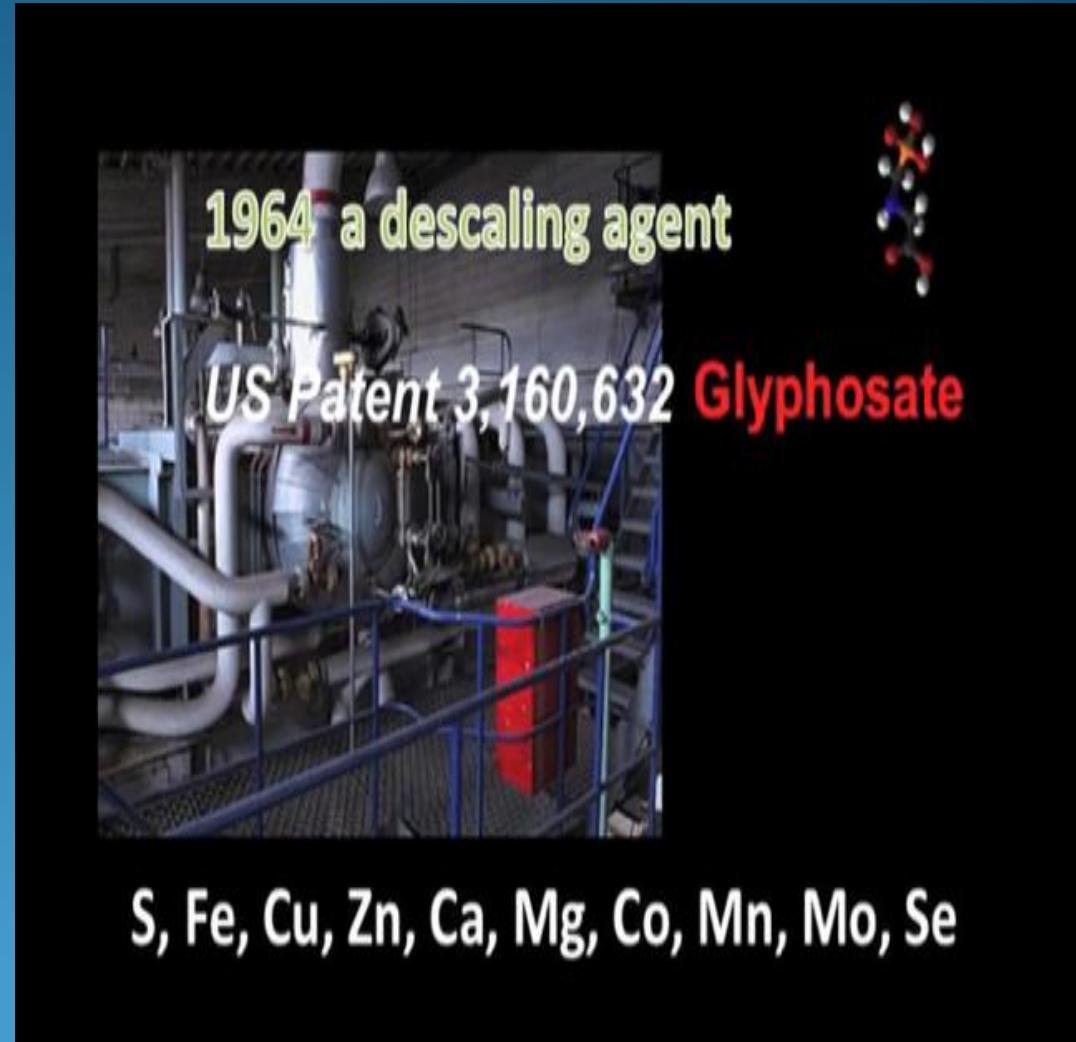

¡El herbicida más utilizado en el mundo!

¿Qué es el glifosato?

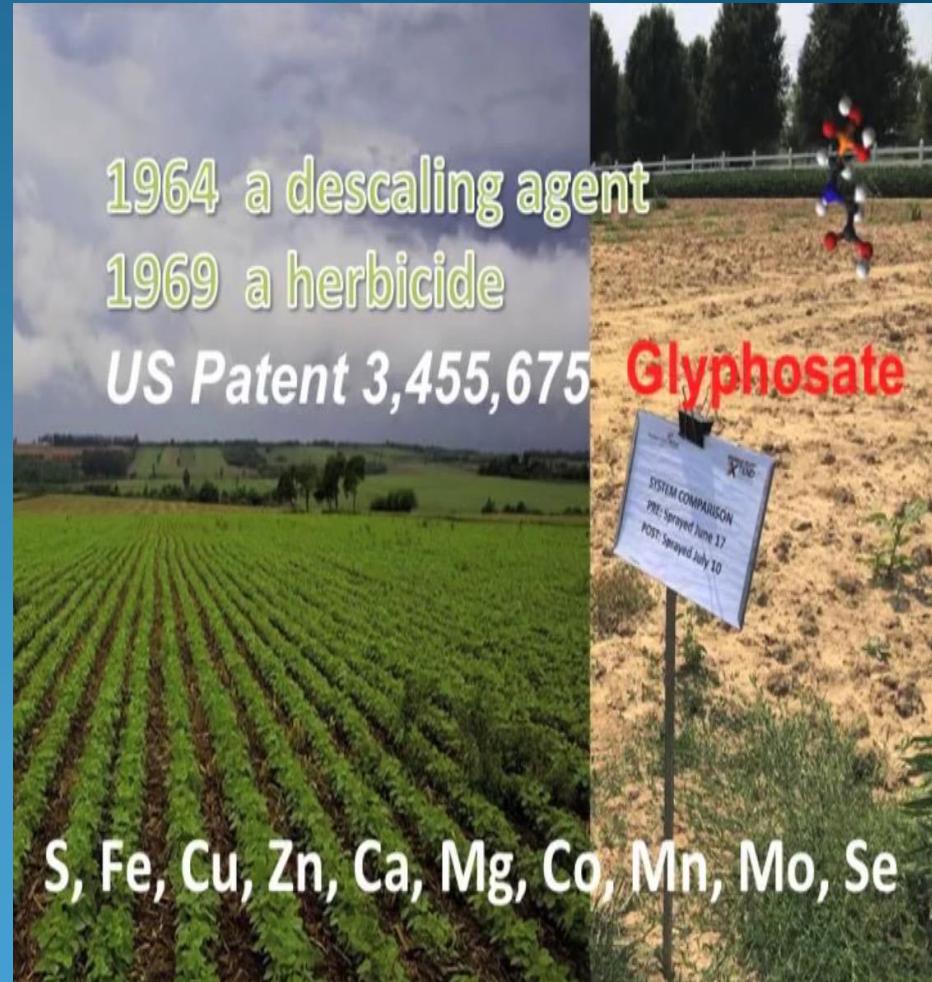

El glifosato

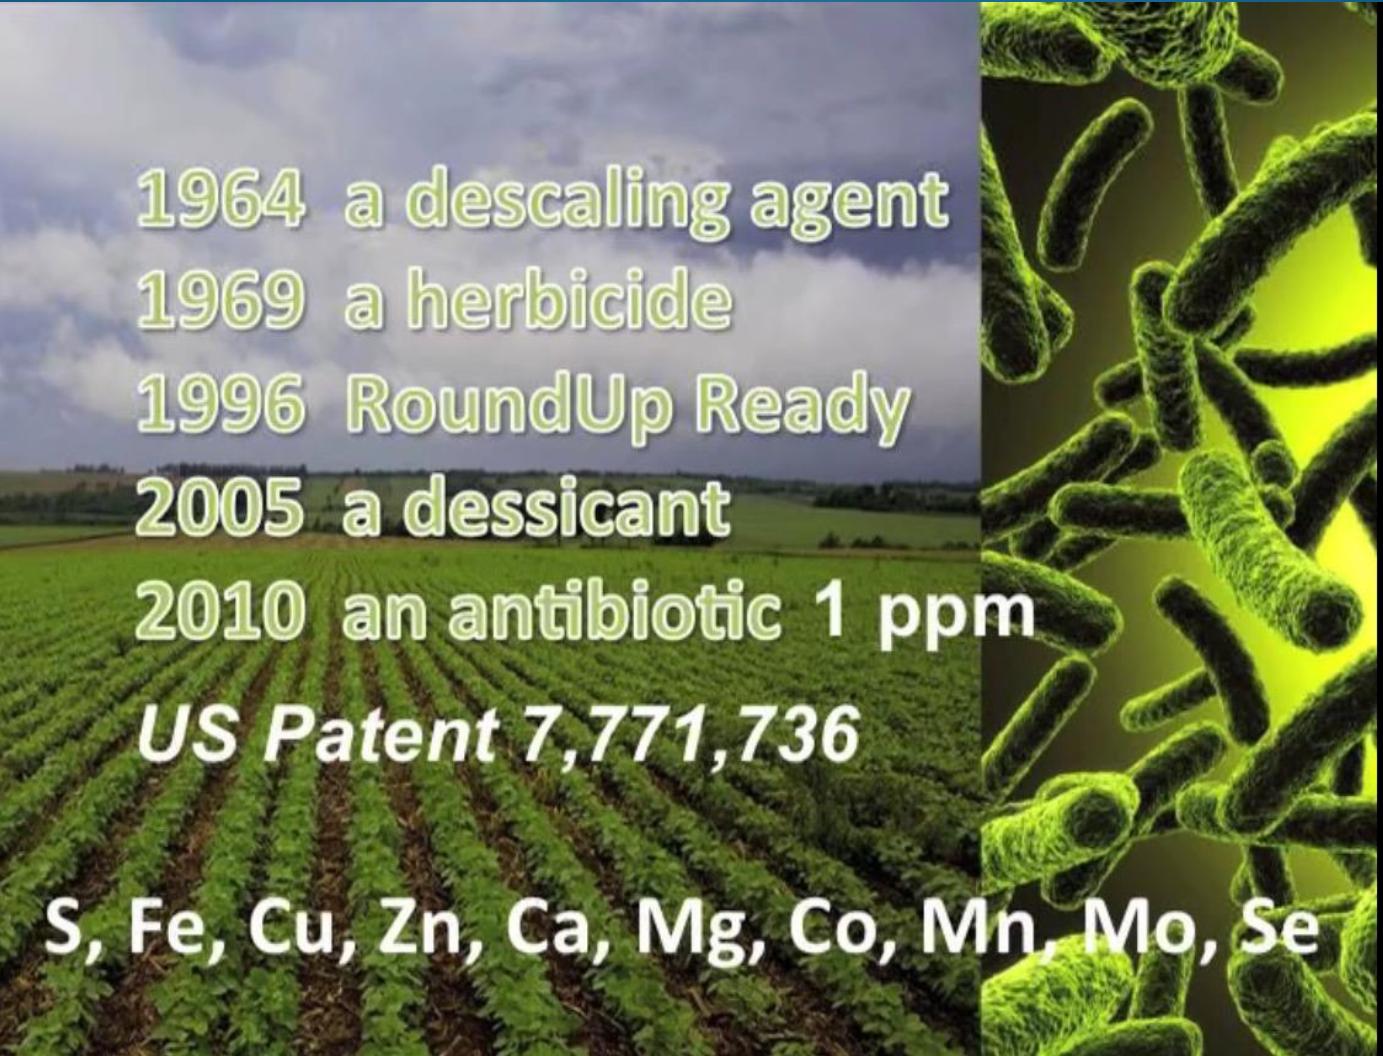

- El glifosato (*Glycine Methyl phosphonate*) fue desarrollado para limpiar las tuberías.
- Es una molécula que se une y atrapa metales. De esta forma, elimina los depósitos de minerales y limpia las tuberías.

El glifosato

- Herbicida no selectivo de amplio espectro que elimina todo tipo de vegetación.
- Se utiliza en el control de malezas en: los hogares y municipios en áreas comunes y públicas.
- En la agricultura convencional.

1964 a descaling agent

1969 a herbicide

1996 RoundUp Ready

2005 a dessicant

2010 an antibiotic 1 ppm

US Patent 7,771,736

S, Fe, Cu, Zn, Ca, Mg, Co, Mn, Mo, Se

Uso en la agricultura y residuos en nuestra mesa...

Aprobación del glifosato

- La clasificación inicial de la EPA fue clase C, lo que significa: “Evidencia Sugestiva de potencial cancerígeno”.

MEMORANDUM

OFFICE OF
PESTICIDES AND TOXIC SUBSTANCES

SUBJECT: Use of historical data in determining the weight of evidence from kidney tumor incidence in the Glyphosate two-year feeding study; and some remarks on false positives

TO: Reto Engler, Chief
Scientific Mission Support Staff
TOX/HED/OPP (TS-769C)

FROM: Herbert Lacayo, Statistician *Herbert Lacayo, Feb 26, 1985*
Scientific Mission Support Staff
TOX/HED/OPP (TS-769C)

THRU: Bertram Litt, Statistics Team Leader *2/26/85*
Scientific Mission Support Staff
TOX/HED/OPP (TS-769C)

BACKGROUND

The Glyphosate feeding study (EPA Reg.-#: 524-308; Caswell #: 661A, Accession #: 251007-014) on Charles River CD-1 mice generated renal tubular adenomas in male mice at the 5000 and 30000 ppm dose levels. The registrant (Monsanto) claims that such tumors are "unrelated to treatment." (ref.1). In support of that they provide historical data from Bio/dynamics and two other laboratories (ref.2).

With respect to historical data we note the large number and variety of factors which influence the life history of rodents in chronic studies. Hence, it is generally agreed that the most relevant historical controls are experiments from the subject laboratory studied within a 3 to 4 year "window" (ref.3).

SUMMARY

The main purpose of this memo is to show one way historical data may be used to evaluate the significance of tumors in the glyphosate feeding study. When these data are so used we can conclude that Glyphosate dosing has a statistically significant effect (at the p = .006 level) in the production of kidney tumors in male mice. The appropriate procedure is outlined in the next section entitled Use of Historical Data. The last Section, Remarks on False Positives, addresses some comments by Monsanto (Ref.1) on this subject. That section outlines some of the weaknesses in Monsanto's position.

USE OF HISTORICAL DATA

The following information was derived from Reference 2.

Data Source*	p (est.of tumor rate)	Sigma (est.of standard deviation)
Bio/dynamics	.00368	.00212
IRD Corp.	.00437	.00109
Combined	.00399	.00094

The value $p = .00368$, derived from Bio/dynamics data is a reasonable choice to use as a historical control. The data are from the same laboratory that performed the Glyphosate study and are within the appropriate 3-4 year time "window" (ref.3). Further, the standard deviation of the estimate is reasonably small.

We will now examine the Monsanto contention that the kidney tumors are unrelated to treatment. (i.e. Glyphosate has no effect on kidney tumors). First, consider the tumor rate in the Glyphosate Study: $4/198 = .0202$ ---

In contrast, Bio/dynamics has the lower historical rate:

$$3/815 = .00368$$

The relevant question is: What is the probability that the 198 CD-1 mice in the Glyphosate study will produce by pure chance 4 or more mice with kidney tumors? Another way of stating this is - How likely are we to have a tumor rate of .0202 --- for the Glyphosate study given that the historical rate is .00368?

Questions of this type may be answered from manipulation of the relevant distribution which, in this case is the Binomial:

$$P(r \text{ out of } n \text{ mice have tumors}) = \binom{n}{r} p^r q^{n-r}$$

Where: n = the # of male mice in the study

r = the # of male mice with kidney tumors

$p = .00368$, the historical probability that an individual male mouse will develop kidney tumors.

$$q = 1 - p$$

*This does not include Hazleton Laboratories America, Inc. due to the small sample size of that data set

Using the above distribution and elementary but tedious calculations, we generate the following table:

# of mice with tumor	Probability that r or more mice will have tumors in a study with 198 male mice
$r = 0$	1.
1	.518177
2	.165711
3	.037443
4	.006481

This last table indicates that based on a historical rate of $p = .00368$ that the probability of seeing 3 or more mice with kidney tumors is about .037, and the probability of seeing 4 or more such mice (i.e. seeing what in fact happened) is about .0064. We note that even considering data from I.R.D., the p value is about .01.

Under such circumstances a prudent person would reject the Monsanto assumption that Glyphosate dosing has no effect on kidney tumor production. Another way of saying this is that if Glyphosate were truly unrelated to kidney production we would expect to see 4 or more tumors in less than 1 out of 100 experiments of the type sponsored by Monsanto. Thus, Glyphosate is suspect.

REMARKS ON FALSE POSITIVES

In ref. 1 Monsanto notes that "...if 20 types of lesions were evaluated at a probability level of .05, the number expected to be positive would not be one in 20, but rather the probability would be 64 in 100, an unacceptably high value..." Monsanto is referring to the well-known fact that by examining enough data it is likely that one will find an excess of some tumor type by chance alone; thus generating a false positive.

The Monsanto argument required the following assumptions:

1. A mouse may develop 20 distinct and independent (in the statistical sense) types of tumors.
2. The probability of each tumor type in a typical mouse is .05.

It follows from the above that:
 $P(\text{a mouse has at least one tumor}) = 1 - .95^{20}$
 $= .6415$

Hence in 100 mice one would on the average see 64 with tumors. Monsanto proposes to avoid this "problem" of false positives by analyzing the study" ...at the .01 probability level."

We disagree with the Registrants position. First, even if one did analyze the study at the .01 level as they suggest it would still result (using the same mathematics as before) in seeing 18 mice out of 100 with tumors. And hence one still has the problem of false positives from the registrant's viewpoint. But this causes something worse from a regulatory viewpoint. We have decreased the false positive rate (i.e., the probability of saying that a chemical causes tumors when in fact it does not) at the cost of increasing the false negative rate (i.e., the probability of saying that a chemical doesn't cause tumors when in fact it does). The Registrant wishes to avoid false positives while those concerned with the public health wish to avoid false negatives. Hence, for this reason alone Monsanto's argument is unacceptable.

We further disagree as follows:

1. The two assumptions needed to support the Monsanto argument are themselves in need of support (especially the requirement for statistical independence).
2. False positive results are less likely to occur with rare tumors (ref. 5). And the tumors in question are rare.

Viewpoint is a key issue. Our viewpoint is one of protecting the public health when we see suspicious data. It is not our job to protect registrants from false positives. We sympathize with the Registrants problem; but they will have to demonstrate that this positive result is false.

Finally, we mention that none of the tumors occurred in the control or low dose groups. Instead there was one at 5000 ppm and 3 at the 30000 ppm dose level. This together with the previous comments make it likely that there is a dose-tumor relationship for Glyphosate.

³Wildlife Research Institute, Bonn, Germany

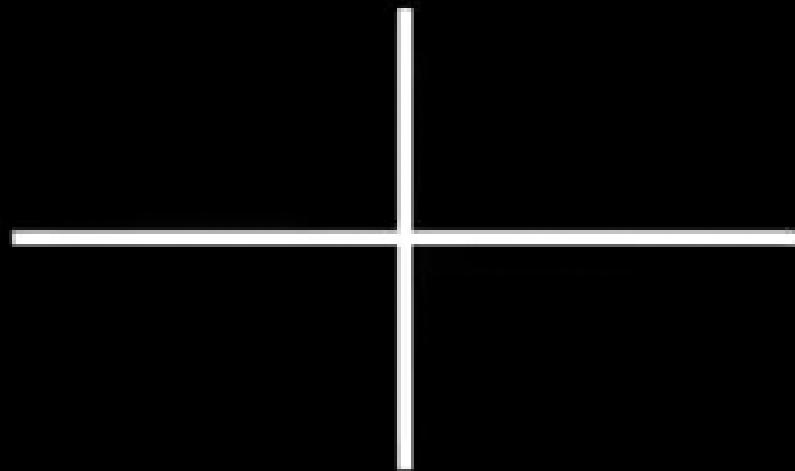

^{*}Avian and Rabbit Diseases Department, Faculty of Veterinary Medicine, Sadat City University, Egypt

Abstract

In the present study glyphosate residues were tested in urine and different organs of dairy cows as well as in urine of hares, rabbits and humans using ELISA and Gas Chromatography-Mass Spectroscopy (GC-MS). The correlation coefficients between ELISA and GC-MS were 0.96, 0.87, 0.97 and 0.96 for cattle, human, and rabbit urine and organs, respectively. The recovery rate of glyphosate in spiked meat using ELISA was 91%. Glyphosate excretion in German dairy cows was significantly lower than Danish cows. Cows kept in genetically modified free area had significantly lower glyphosate concentrations in urine than conventional husbandry cows. Also glyphosate was detected in different organs of slaughtered cows as intestine, liver, muscles, spleen and kidney. Fattening rabbits showed significantly higher glyphosate residues in urine than hares. Moreover, glyphosate was significantly higher in urine of humans with conventional feeding. Furthermore, chronically ill humans showed significantly higher glyphosate residues in urine than healthy population. The presence of glyphosate residues in both humans and animals could haul the entire population towards numerous health hazards, studying the impact of glyphosate residues on health is warranted and the global regulations for the use of glyphosate may have to be re-evaluated.

Glyphosate accumulates in the lungs, heart, kidneys, intestine, liver, spleen, muscles, bones ...

Monsanto y ahora Bayer insisten en la seguridad del glifosato

Francia reporta espionaje por parte de Monsanto... (mayo 13- 2019)

Monsanto espió a políticos, científicos, periodistas y líderes agrícolas: Bayer...

listado- y el canal *France2*. La denuncia apunta al responsable de "la recolección de datos personales por medio fraudulento, desleal e ilícito".

La empresa alemana **Bayer** anunció que contratará un bufete de abogados externo para que investigue el proyecto de **Monsanto** que según medios franceses se creó para **reprimir críticas y presionar** a fin de conseguir la aprobación de pesticidas, incluido el controvertido herbicida **Roundup**.

Los archivos incursionan no sólo en las posiciones de los centenares de investigados respecto a los pesticidas, de Monsanto y de los OGM, sino también abarcan **informes sobre sus pasatiempos, capacidad de ser influenciados y direcciones y teléfonos**

Monsanto tenía espías de personalidades en siete países

Estos espías afectaban "principalmente a periodistas, políticos y otros grupos de interés".

Por **Radio Isla** - May 21, 2019 👁 58

Nuevo informe toxicológico del glifosato- abril, 2019 que estuvo detenido por directivos de la EPA- “Si puedo paralizar esto, me merezco una medalla”, Jess Rowland.

Confirmado el efecto cancerígeno del glifosato por la Agencia de Substancias tóxicas y registro de enfermedades del Departamento de Salud y Servicios Humanos de Estados Unidos, “Department of Health and Human Services (DHHS), the Agency for Toxic Substances and Disease Registry (ATSDR), released the long-awaited Draft Toxicological Profile for Glyphosate”.

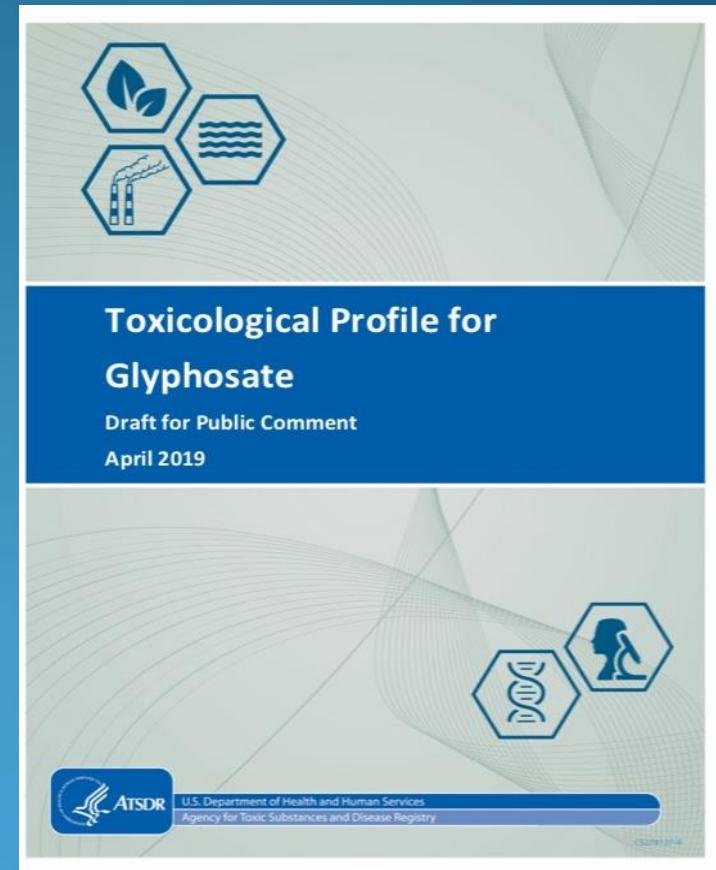

Toxicological Profile for Glyphosate

Draft for Public Comment

NRDC.ORG

ATSDR Report Confirms Glyphosate
Cancer Risks

Correos internos revelan complicidad de la EPA...

The court documents included Monsanto's internal emails and email traffic between the company and federal regulators. The records suggested that Monsanto had ghostwritten research that was later attributed to academics and indicated that a senior official at the Environmental Protection Agency had worked to quash a review of Roundup's main ingredient, glyphosate, that was to have been conducted by the United States Department of Health and Human Services.

The documents also revealed that there was some disagreement within the E.P.A. over its own safety assessment.

Dan Jenkins, a Monsanto executive, said in an email in 2015 that Mr. Rowland, referring to the other agency's potential review, had told him, "If I can kill this, I should get a medal."

The review never took place. In another email, Mr. Jenkins noted to a colleague that Mr. Rowland was planning to retire and said he "could be useful as we move forward with ongoing glyphosate defense."

Resumen de daños del ATSD

An overview of the number of human and animal studies examining potential endpoints of concern from exposure to glyphosate formulations is presented in Figure 2-2. Results from available animal studies identify the following targets of toxicity:

- **Developmental effects:** Histopathologic testicular lesions, decreased sperm production, and increased incidence of fetal skeletal malformations were reported in response to oral dosing of rat weanlings or pregnant rats with selected glyphosate formulations in the range of 5–500 mg/kg/day.
- **Endocrine effects:** Decreased serum testosterone was noted in male rat weanlings administered a glyphosate formulation orally at 5 mg/kg/day.
- **Body weight effects:** Seriously depressed body weight gain was observed in mice administered a glyphosate formulation orally at 50 mg/kg/day.
- **Renal effects:** Histopathologic kidney lesions were noted in male rats gavaged once with a glyphosate formulation at 250 mg/kg.
- **Hepatic effects:** Increased serum liver enzyme activity and histopathologic liver lesions were reported in male rats repeatedly gavaged with a glyphosate formulation at 487 mg/kg/day.
- **Hematological effects:** Decreases in red blood cells, hematocrit, and hemoglobin, and increases in mean corpuscular volume and neutrophils were reported in mice administered a glyphosate formulation orally at 500 mg/kg/day.
- **Reproductive effects:** Increased percentage of morphologically abnormal sperm was reported among rats receiving a glyphosate formulation from the drinking water for 8 days at 640 mg/kg/day.

**Glifosato: desgarradora carta
antes de morir de una científica
de la EPA "sí, causa cáncer"**

Resumen del daño toxicológico

La carta de la científica de la EPA Marion Copley, que falleció víctima de cáncer, fué descubierta en los documentos no sellados originalmente por el Tribunal del Distrito Norte de California, USA, en la "Acción Civil N° 16-MD-02741-VC Monsanto Company, sobre responsabilidad por el herbicida RoundUp". La carta la dió a conocer el grupo anti-GMO 'US Right to Know (USRTK), y fué publicado en el sitio Glyphosate.news

En la carta, Copley le pide al científico Jess Rowland, llamado el "topo de Monsanto" dentro de la EPA, que "deje mentir sobre los peligros del RoundUp (Glifosato).

-"Cualquiera de estos mecanismos por sí solos puede causar tumores, pero el glifosato causa todos ellos simultáneamente". Copley señaló que el glifosato fue previamente clasificado por la EPA como un "POSSIBLE carcinógeno humano", y argumentó que, de acuerdo con los conocimientos de la EPA sobre el producto químico, la EPA debería re-clasificar el glifosato como "**PROBABLE carcinógeno humano**".

En esta carta, Copley le pide a Jess Rowland que haga su trabajo y proteja al público en lugar de proteger los intereses de Monsanto, diciéndole : **"Por una vez en tu vida, escúchame y no hagas tu juego de connivencia política con la ciencia para favorecer a los registrantes. Por una vez haz lo correcto y no tomes decisiones basadas en cómo afecta a tu bono"**. En dicha correspondencia, la toxicóloga cita pruebas de estudios en animales y escribe: **"Es esencialmente cierto que el glifosato causa cáncer"**.

Organización Mundial de la Salud alertó en marzo del 2015 que el glifosato es cancerígeno en animales y probable cancerígeno en humanos. Este pronunciamiento ha sido apoyado por más de 100 científicos de más de 25 países en el mundo.

**GLYPHOSATE CARCINOGENICITY REPORT

Journal flags papers, saying authors didn't adequately disclose ties to Monsanto

The image shows the front cover of the journal "Critical Reviews in Toxicology". The cover is red with abstract, overlapping white shapes. At the top, the ISSN (1040-8444), volume (Volume 39), number (Number 1), and month (January 2009) are listed. The title "Critical Reviews in Toxicology" is prominently displayed in large, white, serif capital letters in the lower-left quadrant. Below the title, the editor's name, "Editor — Roger O. McClellan", is written in a smaller, white, sans-serif font.

A toxicology journal has issued an expression of concern for a group of papers about the controversial herbicide glyphosate after concluding that some of the authors didn't adequately disclose their ties to the maker of the product.

At issue are five articles that appeared in a 2016 supplement to Critical Reviews in Toxicology, a Taylor & Francis title, about the chemical, the active ingredient in Monsanto's blockbuster weed-killer Roundup. Although the authors of the articles don't overlap perfectly, Keith Solomon, of the University of Guelph, in Canada, appears on three of the articles; Gary Williams, of New York Medical College, appears on three as well.

Williams was caught up in a ghost-writing scandal after court documents revealed that he had put his name on a published paper written by Monsanto employees. Solomon

Revisores actualizados con nuevas secciones de Agradecimientos y Declaración de Intereses

Varios de los autores presentaron sus disculpas en las secciones actualizadas de la Declaración de intereses de tres de los cinco documentos de revisión, entre ellos:

Keith R. Solomon (ha trabajado como consultor para Monsanto)

David Brusick (ha trabajado como consultor para Monsanto)

Marilyn Aardema

Larry Kier (ha trabajado como consultor para Monsanto)

David Kirkland (ha trabajado como consultor para Monsanto)

Gary Williams (ha trabajado como consultor para Monsanto)

John Acquavella (antiguo empleado de Monsanto, ha trabajado como consultor para Monsanto)

David Garabrant

Gary Marsh

Tom Sorahan (antiguo empleado de Monsanto, ha trabajado como consultor para Monsanto)

Gracias al uso masivo de herbicidas en todo el planeta, seguramente hemos inhalado una dosis del herbicida mejor vendido de Monsanto, Roundup, según el último estudio del US Geological Survey publicado en la revista *Environmental Toxicology and Chemistry*.

- Roundup era preponderante (en aire y lluvia) así como otros 37 compuestos tóxicos.
- Se encontró glifosato en el 86% de las muestras de aire y en el 77% de lluvia.

Daño al ambiente y las abejas

- Desoriente las abejas
- Reduce la biodiversidad
- Compactación de los suelos
- Creación de “súper malezas”
- Responsable de nuevas plagas

Impacto a la salud del glifosato

Principales problemas a la salud:

- Alergias
- Problemas gastrointestinales: inflamación, irritación y cambios en la flora intestinal

Dr. Phillip J. Landrigan,
Epidemiólogo y Pediatra
solicita que:

1. La Academia Nacional de Ciencias nombre un nuevo comité para una nueva evaluación sobre el daño de los pesticidas, particularmente el glifosato y los GMO.
2. Señala el serio problema actual en la población por el gran incremento en las alergias.

ABSTRACT

One of the important objectives of this manuscript is to focus on the place of erectile dysfunction as an important factor for infertility. The review is about correlating the indiscriminate use of pesticides and to find out and highlight the evidences for mechanism of action of these pesticides for erectile dysfunction and find out the most used and most dangerous pesticide from erectile dysfunction point of view. The review suggests that erectile dysfunction is having a significant place as a causal factor for infertility. Study infers that pesticides are having multiple mechanisms of action through which these cause erectile dysfunction. It also reflects that acetamiprid is having most devastating effect causing erectile dysfunction as it acts through multiple inhibitory pathways. The review successfully highlights the indiscriminate regional use of pesticides.

Abstract

Glyphosate is the active ingredient and polyoxyethyleneamine, the major component, is the surfactant present in the herbicide Roundup formulation. The objective of this study was to analyze potential cytotoxicity of the Roundup and its fundamental substance (glyphosate). Albino male rats were intraperitoneally treated with sub-lethal concentration of Roundup (269.9mg/kg) or glyphosate (134.95mg/kg) each 2 days, during 2 weeks. Hepatotoxicity was monitored by quantitative analysis of the serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), alkaline phosphatase (ALP) activities, total protein, albumin, triglyceride and cholesterol. Creatinine and urea were used as the biochemical markers of kidney damages. The second aim of this study to investigate how glyphosate alone or included in herbicide Roundup affected hepatic

Roundup disrupts male reproductive functions by triggering calcium-mediated cell death in rat testis and Sertoli cells.

de Liz Oliveira Cavalli VL, et al. Free Radic Biol Med. 2013.
[Show full citation](#)

Abstract

Glyphosate is the primary active constituent of the commercial pesticide Roundup. The present results show that acute Roundup exposure at low doses (36 ppm, 0.036 g/L) for 30 min induces oxidative stress and activates multiple stress-response pathways leading to Sertoli cell death in prepubertal rat testis. The pesticide increased intracellular Ca(2+) concentration by opening L-type voltage-dependent Ca(2+) channels as well as endoplasmic reticulum IP3 and ryanodine receptors, leading to Ca(2+) overload within the cells, which set off oxidative stress and necrotic cell death. Similarly, 30 min incubation of testis with glyphosate alone (36 ppm) also increased (45)Ca(2+) uptake. These events were prevented by the antioxidants Trolox and ascorbic acid. Activated protein kinase C phosphorylates c-Jun kinase and the

Mechanisms underlying the neurotoxicity induced by glyphosate-based herbicide in immature rat hippocampus: involvement of glutamate excitotoxicity.

Cattani D, et al. Toxicology. 2014.

[Show full citation](#)

Abstract

Previous studies demonstrate that glyphosate exposure is associated with oxidative damage and neurotoxicity. Therefore, the mechanism of glyphosate-induced neurotoxic effects needs to be determined. The aim of this study was to investigate whether Roundup® (a glyphosate-based herbicide) leads to neurotoxicity in hippocampus of immature rats following acute (30min) and chronic (pregnancy and lactation) pesticide exposure. Maternal exposure to pesticide was undertaken by treating dams orally with 1% Roundup® (0.38% glyphosate) during pregnancy and lactation (till 15-day-old). Hippocampal slices from 15 day old rats were acutely exposed to Roundup® (0.00005-0.1%) during 30min and experiments were carried out

Abstract

Many neurological diseases, including autism, depression, dementia, anxiety disorder and Parkinson's disease, are associated with abnormal sleep patterns, which are directly linked to pineal gland dysfunction. The pineal gland is highly susceptible to environmental toxicants. Two pervasive substances in modern industrialized nations are aluminum and glyphosate, the active ingredient in the herbicide, Roundup®. In this paper, we show how these two toxicants work synergistically to induce neurological damage. Glyphosate disrupts gut bacteria, leading to an overgrowth of Clostridium difficile. Its toxic product, p-cresol, is linked to autism in both human and mouse models. p-Cresol enhances uptake of aluminum via transferrin. Anemia, a result of both aluminum disruption of heme and impaired heme synthesis by glyphosate, leads to hypoxia, which induces increased pineal gland transferrin synthesis. Premature birth is associated with hypoxic stress and with substantial increased risk to the subsequent development of autism, linking hypoxia to autism. Glyphosate chelates aluminum, allowing ingested aluminum to bypass the gut barrier. This leads to anemia-induced hypoxia, promoting neurotoxicity and damaging the pineal gland. Both glyphosate and aluminum disrupt cytochrome P450 enzymes, which are involved in melatonin metabolism. Furthermore, melatonin is derived from tryptophan, whose synthesis in plants and microbes is blocked by glyphosate. We also demonstrate a plausible role for vitamin D3 dysbiosis in impaired gut function and impaired serotonin synthesis. This paper proposes that impaired sulfate supply to the brain mediates the damage induced by the synergistic action of aluminum and glyphosate on the pineal gland and related midbrain nuclei.

Abstract

Parental exposure to pesticides may contribute to childhood cancer risk. Through the Agricultural Health Study, a prospective study of pesticide applicators in Iowa and North Carolina, we examined childhood cancer risk and associations with parental pesticide application. Identifying information for 17,357 children of Iowa pesticide applicators was provided by parents via questionnaires (1993-1997) and matched against the Iowa Cancer Registry. Fifty incident childhood cancers were identified (1975-1998). Risk of all childhood cancers combined was increased [standardized incidence ratio (SIR) = 1.36; 95% confidence interval (CI), 1.03-1.79]. Risk of all lymphomas combined was also increased (SIR = 2.18; 95% CI, 1.13-4.19), as was risk of Hodgkin's lymphoma (SIR = 2.56; 95% CI, 1.06-6.14). We used logistic regression to explore associations between self-reported parental pesticide application practices and childhood cancer risk. No association was detected between frequency of parental pesticide application and childhood cancer risk. An increased risk of cancer was detected among children whose fathers did not use chemically resistant gloves [odds ratio (OR) = 1.98; 95% CI, 1.05-3.76] compared with children whose fathers used gloves. Of 16 specific pesticides used by fathers prenatally, ORs were increased for aldrin (OR = 2.66), dichlorvos (OR = 2.06), and ethyl dipropylthiocarbamate (OR = 1.91). However, these results were based on small numbers and not supported by prior biologic evidence. Identification of excess lymphoma risk suggests that farm exposures including pesticides may play a role in the etiology of childhood lymphoma.

El glifosato y el linfoma Non Hodgkin

El riesgo de este cáncer aumenta en un 41% cuando la persona se expone al glifosato.

Received: 12 February 2014; *in revised form:* 31 March 2014 / *Accepted:* 1 April 2014 / *Published:* 23 April 2014

Abstract: This paper describes results from a systematic review and a series of meta-analyses of nearly three decades worth of epidemiologic research on the relationship between non-Hodgkin lymphoma (NHL) and occupational exposure to agricultural pesticide active ingredients and chemical groups. Estimates of associations of NHL with 21 pesticide chemical groups and 80 active ingredients were extracted from 44 papers, all of which reported results from analyses of studies conducted in high-income countries. Random effects meta-analyses showed that phenoxy herbicides, carbamate insecticides, organophosphorus insecticides and the active ingredient lindane, an organochlorine insecticide, were positively associated with NHL. In a handful of papers, associations between pesticides and NHL subtypes were reported; B cell lymphoma was positively associated with phenoxy herbicides and the organophosphorus herbicide, glyphosate. Diffuse large B-cell lymphoma was positively associated with phenoxy herbicide exposure. Despite compelling evidence that NHL is associated with certain chemicals, this review indicates the need for investigations of a larger variety of pesticides in more geographic areas, especially in low- and middle-income countries, which, despite producing a large portion of the world's agriculture, were missing in the literature that were reviewed.

Glyphosate-based pesticides affect cell cycle regulation.

Marc J, et al. Biol Cell. 2004.

[Show full citation](#)

Abstract

Cell-cycle dysregulation is a hallmark of tumor cells and human cancers. Failure in the cell-cycle checkpoints leads to genomic instability and subsequent development of cancers from the initial affected cell. A worldwide used product Roundup 3plus, based on glyphosate as the active herbicide, was suggested to be of human health concern since it induced cell cycle dysfunction as judged from analysis of the first cell division of sea urchin embryos, a recognized model for cell cycle studies. Several glyphosate-based pesticides from different manufacturers were assayed in comparison with Roundup 3plus for their ability to interfere with the cell cycle regulation. All the tested products, Amega, Cargly, Cosmic, and Roundup Provept induced cell cycle dysfunction.

ARTÍCULO ORIGINAL

Malformaciones congénitas asociadas a agrotóxicos

Stella Benítez-Leite¹, María Luisa Macchi¹, Matilde Acosta²

Resumen

Introducción: la exposición a plaguicidas es un riesgo reconocido para la salud humana. Se describe la relación entre la exposición de los padres y malformaciones congénitas en el neonato.

Objetivo: estudiar la asociación entre la exposición a pesticidas y malformaciones congénitas en neonatos nacidos en el Hospital Regional de Encarnación, Itapúa-Paraguay.

Material y método: estudio prospectivo de casos y controles de marzo de 2006 a febrero de 2007. Se consideró caso a todo neonato con malformación congénita, y control a todo niño sano del mismo sexo que nació inmediatamente después. No se incluyeron los nacimientos ocurridos fuera del hospital. Se consideró exposición a cualquier contacto con agroquímicos, así como a otros factores de riesgo conocidos para malformación congénita.

Resultados: se analizaron 52 casos y 87 controles. El promedio de nacimientos por mes fue de 216. Los factores de riesgo asociados significativamente fueron: vivir cerca de campos fumigados ($OR = 2,46$, IC95% 1,09-5,57, $p < 0,02$), vivienda ubicada a menos de 1 km ($OR = 2,66$, IC95% 1,19-5,97, $p < 0,008$), almacenamiento de plaguicidas en el hogar ($OR = 15,35$, IC95% 1,96-701,63, $p < 0,003$), contacto en forma directa o accidental con plaguicidas ($OR = 3,19$, IC95% 0,97-11,4, $p < 0,04$), antecedente de malformación en la familia ($OR = 6,81$, IC95% 1,94-30,56, $p < 0,001$). Los demás factores de riesgo conocidos para malformaciones no tuvieron significancia estadística.

Conclusion: los resultados muestran una asociación entre exposición a pesticidas y malformaciones congénitas. Se requiere de estudios futuros para confirmar estos hallazgos.

Summary

Introduction: exposure to pesticides is a known risk for human health. This paper describes the relationship between parental exposure and congenital malformations in the newborn.

Objective: to study the association between exposure to pesticides and congenital malformations in neonates born in the Regional Hospital of Encarnación, in the Department of Itapúa, Paraguay.

Materials and methods: a prospective case-controlled study carried out from March 2006 to February 2007. Cases included all newborns with congenital malformations, and controls were all healthy children of the same sex born immediately thereafter. Births outside the hospital were not counted. Exposure was considered to be any contact with agricultural chemicals, in addition to other known risk factors for congenital defects.

Results: a total of 52 cases and 87 controls were analyzed. The average number of births each month was 216. The significantly associated risk factors were: living near treated fields ($OR = 2,46$, IC95% 1,09-5,57, $p < 0,02$), dwelling located less than 1 km ($OR = 2,66$, IC95% 1,19-5,97, $p < 0,008$), storage of pesticides in the home ($OR = 15,35$, IC95% 1,96-701,63, $p < 0,003$), direct or accidental contact with pesticides ($OR = 3,19$, IC95% 0,97-11,4, $p < 0,04$), and family history of malformation ($OR = 6,81$, IC95% 1,94-30,56, $p < 0,001$). Other known risk factors for malformations did not show statistical significance.

Conclusion: the results show an association between exposure to pesticides and congenital malformations. Further studies are required to confirm these findings.

Dr. Andrés Carrasco del Laboratorio de Embriología Molecular

1. Estudio hecho en anfibios demostró que el herbicida Roundup induce a la muerte celular e interfiere con los mecanismos de reparación fisiológica del DNA lo que puede incrementar el riesgo de mutaciones.

2. El mecanismo que describe el estudio es la alteración del “retinoic acid signaling pathway”. Este mecanismo está presente en los vertebrados (humanos) y asegura el correcto desarrollo de los órganos, huesos y tejidos ya que determina el tiempo exacto y el lugar de desarrollo de los órganos y tejidos en los embriones.

Glyphosate-Based Herbicides Produce Teratogenic Effects on Vertebrates by Impairing Retinoic Acid Signaling

The broad spectrum herbicide glyphosate is widely used in agriculture worldwide. There has been ongoing controversy regarding the possible adverse effects of glyphosate on the environment and on human health. Reports of neural defects and craniofacial malformations from regions where glyphosate-based herbicides (GBH) are used led us to undertake an embryological approach to explore the effects of low doses of glyphosate in development. *Xenopus laevis*

Informe de la Organización Earth Open Source sobre el glifosato y malformaciones

Acerca de los autores

Michael Antoniou, PhD (doctor en medicina) es lector en genética molecular y dirige el Grupo de Terapia y Expresión Genética del King's College de la Escuela de Medicina de Londres, Reino Unido. Tiene 28 años de experiencia en el uso de la tecnología de ingeniería genética, investigando la organización y el control de los genes, con más de 40 papers con revisión de pares de su trabajo original, y status de descubridor en varias patentes de biotecnología de expresión de genes. El Dr. Antoniou tiene una vasta red de colaboradores en la industria y el mundo académico que están utilizando sus descubrimientos sobre mecanismos de control de los genes para la elaboración de productos seguros y eficaces de investigación, diagnóstico y terapia y terapia genética humana somática para alteraciones heredadas y adquiridas.

Roundup and birth defects: Is the public being kept in the dark?

4

Taken together, the industry studies and regulatory documents on which the current approval of glyphosate rests reveal that:

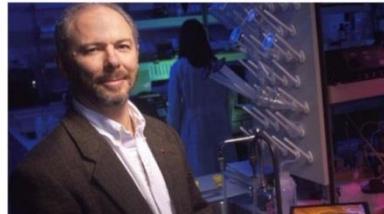

- Industry (including Monsanto) has known since the 1980s that glyphosate causes malformations in experimental animals at high doses
- Industry has known since 1993 that these effects could also occur at lower and mid doses
- The German government has known since at least 1998 that glyphosate causes malformations

Nuevo estudio- daño generacional

Glyphosate Causes Serious Multi-Generational Health Damage to Rats – New WSU Research

Posted on Apr 23 2019 - 10:45pm by Sustainable Pulse
« PREVIOUS |

Washington State University (WSU) researchers have found a variety of diseases and other health problems in the second- and third-generation offspring of rats exposed to glyphosate, the world's most used weed killer. In the first study of its kind, the researchers saw descendants of exposed rats developing prostate, kidney and ovarian diseases, obesity and birth abnormalities.

Michael Skinner, a WSU professor of biological sciences, and his colleagues

Washington State University (WSU) researchers have found a variety of diseases and other health problems in the second- and third-generation offspring of rats exposed to glyphosate, the world's most used weed killer.

In the first study of its kind, the researchers saw descendants of exposed rats developing prostate, kidney and ovarian diseases, obesity and birth abnormalities.

New WSU Research Glyphosate Causes Serious Multi-Generational Health Damage to Rats

The research found no abnormalities in PARENTS or FIRST GENERATION offspring, that were exposed to a dose, half the amount expected to show no adverse effects.

However...

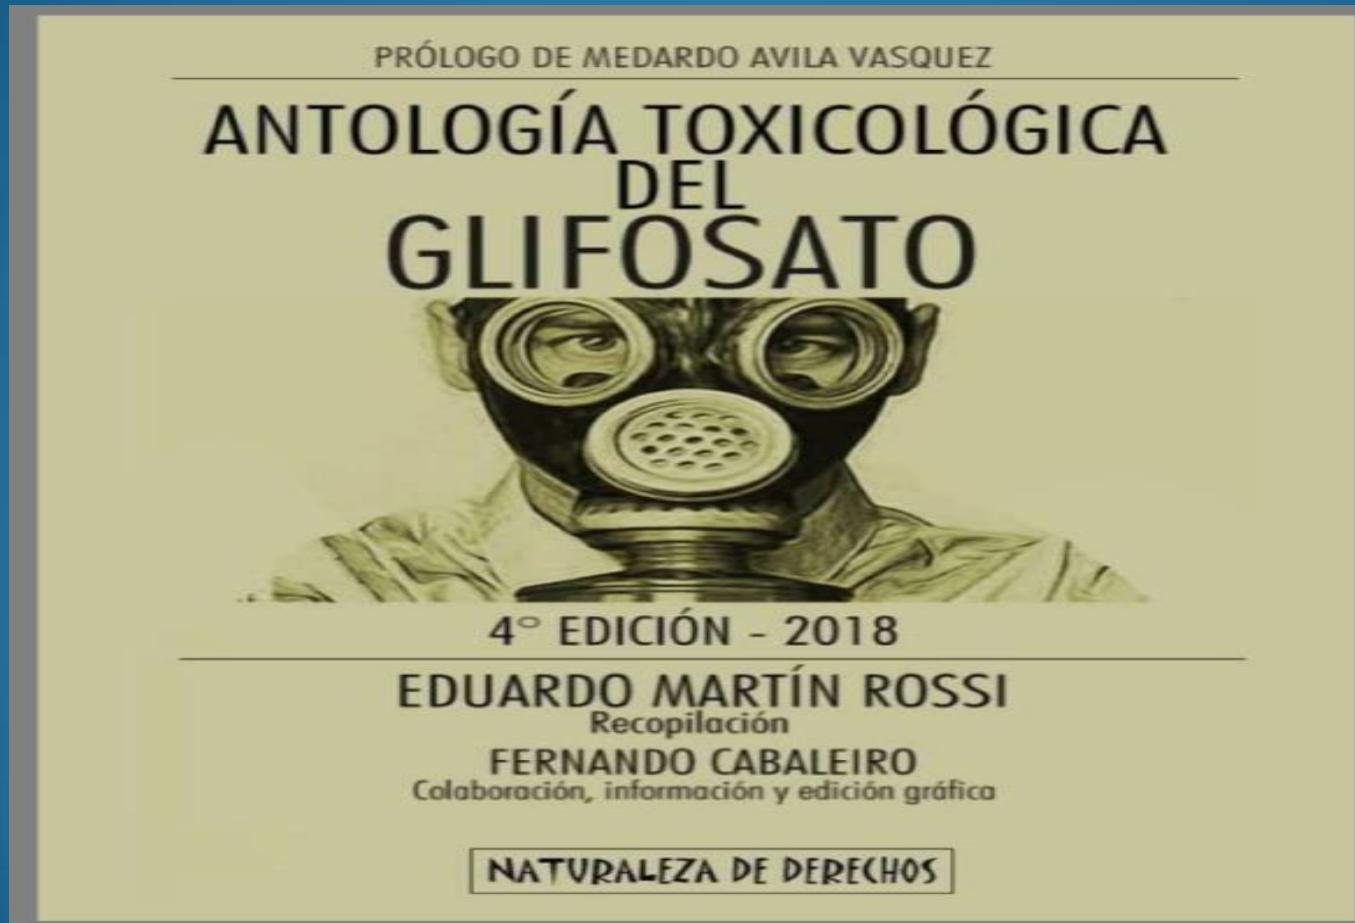

...the researchers saw "dramatic increases" in several pathologies affecting the SECOND and THIRD GENERATIONS.

- **SECOND GENERATION**
 - had "significant increases" in testis, ovary and mammary gland diseases, as well as obesity;
 - More than one-third of the mothers had unsuccessful pregnancies.

- **THIRD GENERATION**
 - males - the researchers saw a 30% increase in prostate disease – three times that of a control population;
 - females - 40% increase in kidney disease, or four times that of the controls;
 - 2 out of 5 males and females were obese.

Más de 800 estudios que demuestran toxicidad del glifosato

¡Urge el principio de precaución!

- Remedio ético ante incertidumbres o controversias sobre un posible daño.
- Para aplicarlo no se necesita gran evidencia y en el caso del glifosato existe amplia investigación que lo vincula a múltiples enfermedades.
- Este principio ha sido aplicado por Francia, Noruega, Rusia y otros países.

Prohibición del glifosato en:

Estados Unidos:

1. La ciudad de Miami
2. Los Angeles
3. New York

Puerto Rico:

1. Aguas Buenas
2. San Juan
3. Proyecto en el Senado

EHN.ORG

**NYC leaders join calls for ban on
Monsanto herbicide**

Posición sobre el Proyecto De O. 43 Ordenanza Para Prohibir el Glifosato

- Apoyo a la prohibición del uso del glifosato en SanJuan y Puerto Rico.
- Exhortación a una prohibición de su distribución y ventas.

¡Gracias!
